13th Annual Central Texas Water Conservation Symposium  
San Antonio, Texas

February 22, 2023

# Presentation Outline

## 1) Introduction

## 2) Methodology

## 3) Findings

- Current Water Loss
- Potential For Water Loss Reduction
- Comparative Cost Effectiveness

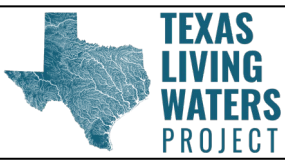

## 4) Recommendations

## 5) Follow-up

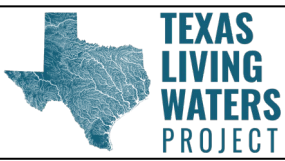

# 1. Introduction

- **Purpose:** To raise awareness on the current level of water losses in Texas, the potential for, and the favorable economics for water loss reduction, and increase the use of water loss reduction as a Water Management Strategy.
- **Project Team:** National Wildlife Federation 's Texas Coast and Water Program, Aiqueous, Inc. and an Independent Consultant
- **Timeline:** 2021 - 2022
- **Funding:** The Meadows Foundation and the Cynthia and George Mitchell Foundation
- **Key Collaborator:** Texas Water Development Board

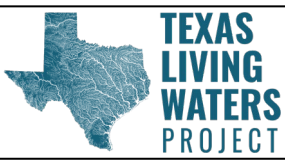

## 2. Methodology

- 1. Water Loss Audits:** Obtained water loss audits from TWDB for 2015 – 2019 (6829 audits). Determined that 2019 audits were consistent with previous years.
- 2. Filtered Sample:** Filtered out potentially inaccurate 2019 audits using criteria used by TWDB and AWWA and created a Sample of the most accurate 2019 water loss audits, n = 823
- 3. Water Loss by Region and Size Class (2019):** Analyzed the Sample for the components of water loss for different Regions and Size Classes, and the **total water loss, in gallons / connection / day**, for each Region (n=16) and water system Size Class (n=4).

# Filtered Water Loss Audits, Texas, 2019

## Acceptable Audits meet these Criteria

| Available Water Loss Audits 2019 |               |
|----------------------------------|---------------|
| Very Large                       | n= 39         |
| Large                            | n= 92         |
| Medium                           | n= 216        |
| Small                            | n= 905        |
| <b>Total</b>                     | <b>n=1252</b> |

| TWDB                |   |
|---------------------|---|
| •                   | Positive Values for Totals of Water loss, Apparent Loss, Unreported Real Loss, Real Loss                  |
| •                   | Customer Meter Accuracy > 90%   |
| •                   | Billed Metered Consumption > 1000 Gals / Connection / Month   |
| •                   | Infrastructure Leakage Index: 1 to 10   |
| •                   | Outlier Values for Population, # of Connections, Length of Mains, Connection Density, or Average Pressure |
| Additional Criteria |   |
| •                   | Connection Density: 4 to 250 Connections/Mile   |
| •                   | Authorized Consumption: 50 to 1000 Gallons/Connection/Day   |
| •                   | Unit Water Loss: 5 to 200 Gallons/Connection/Day  |
| •                   | Water Loss Percentage > 50%   |
| •                   | Unit Real Loss > 3 Gallons/Connection/Day   |
| •                   | <i>Infrastructure Leakage Index: 0.5 to 15 (Expanding Criterion Above)</i>                                |
| •                   | Customer Retail Unit Cost (CRUC): \$500/MG to \$50,000/MG sold  |
| •                   | Variable Production Cost (VPC): \$100/MG to \$20,000/MG produced  |
| •                   | Ratio - CRUC / VPC: 1 to 100  |

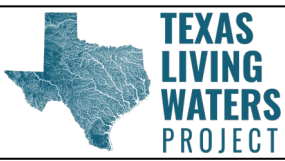

| Filtered Sample for Analysis, 2019 |              |
|------------------------------------|--------------|
| Very Large                         | n= 29        |
| Large                              | n= 59        |
| Medium                             | n=123        |
| Small                              | n=606        |
| <b>Total</b>                       | <b>n=823</b> |

### Utility Size Categories

- Very Large >100,000 people
- Large = 25,000 to 100,000 people
- Medium = 10,000 to 25,000 people
- Small = < 10,000 people

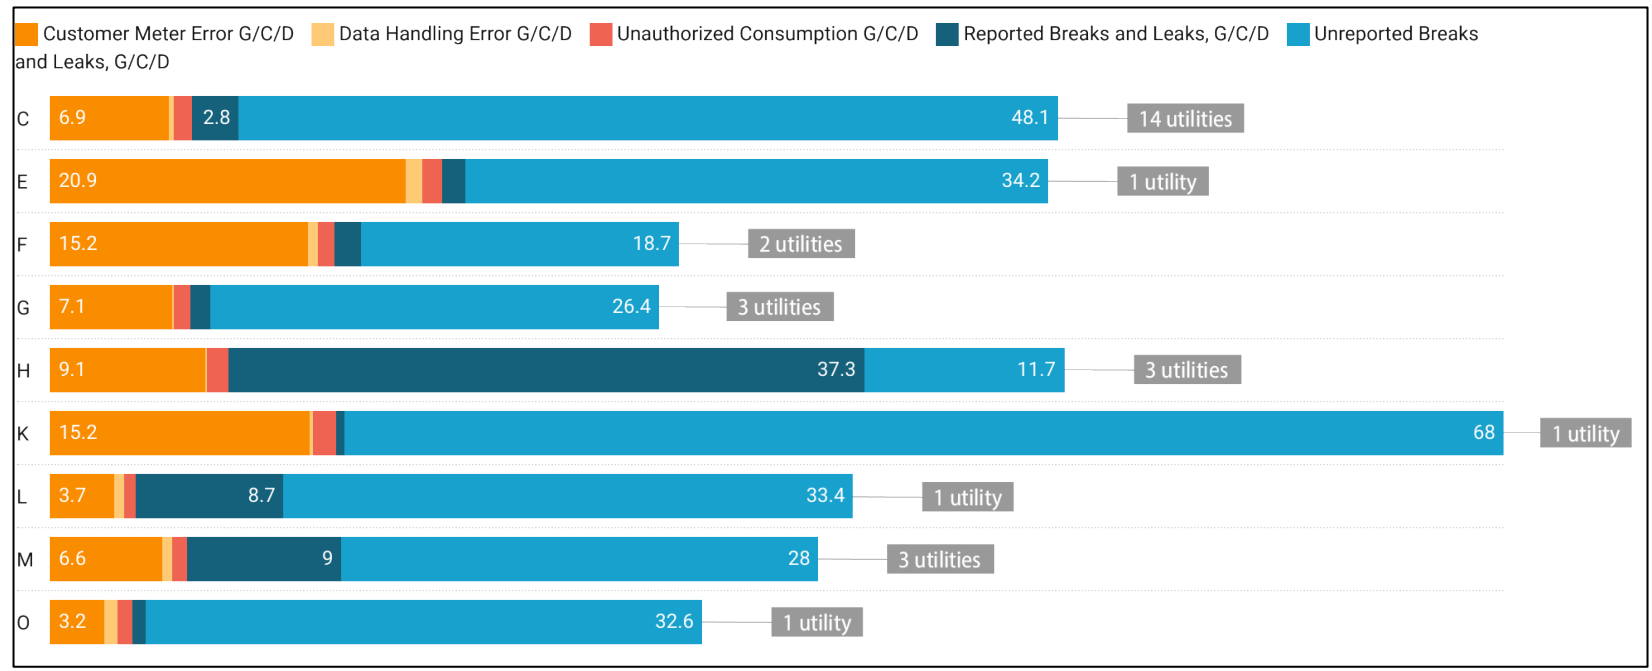

# Components of Water Loss, Texas, 2019

■ Customer Meter Error G/C/D 
 ■ Data Handling Error G/C/D 
 ■ Unauthorized Consumption G/C/D 
 ■ Reported Breaks and Leaks, G/C/D 
 ■ Unreported Breaks and Leaks, G/C/D

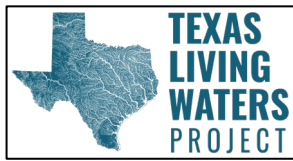

Very Large Utilities by Region

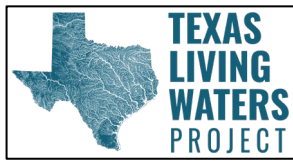

# Methodology

- 5. Scale up to Statewide(2020):** Obtained data from TWDB/TCEQ on the active retail water suppliers in each Region and each Size Class for 2020, and scaled up the Sample results to “Statewide” from 823 to 4,021 retail water suppliers, using total water loss in gallons / connection / day.
- 6. Statewide Analysis:** Conducted multiple analyses in each Region and in each Size Class at the Statewide (2020) level , including total and unit water losses and water loss reduction potential, for three levels of water loss performance (Average, Good Performance and Very Good Performance).
- 7. Comparison of Reduction Potential** to Municipal Needs and SWP Water Loss Projects

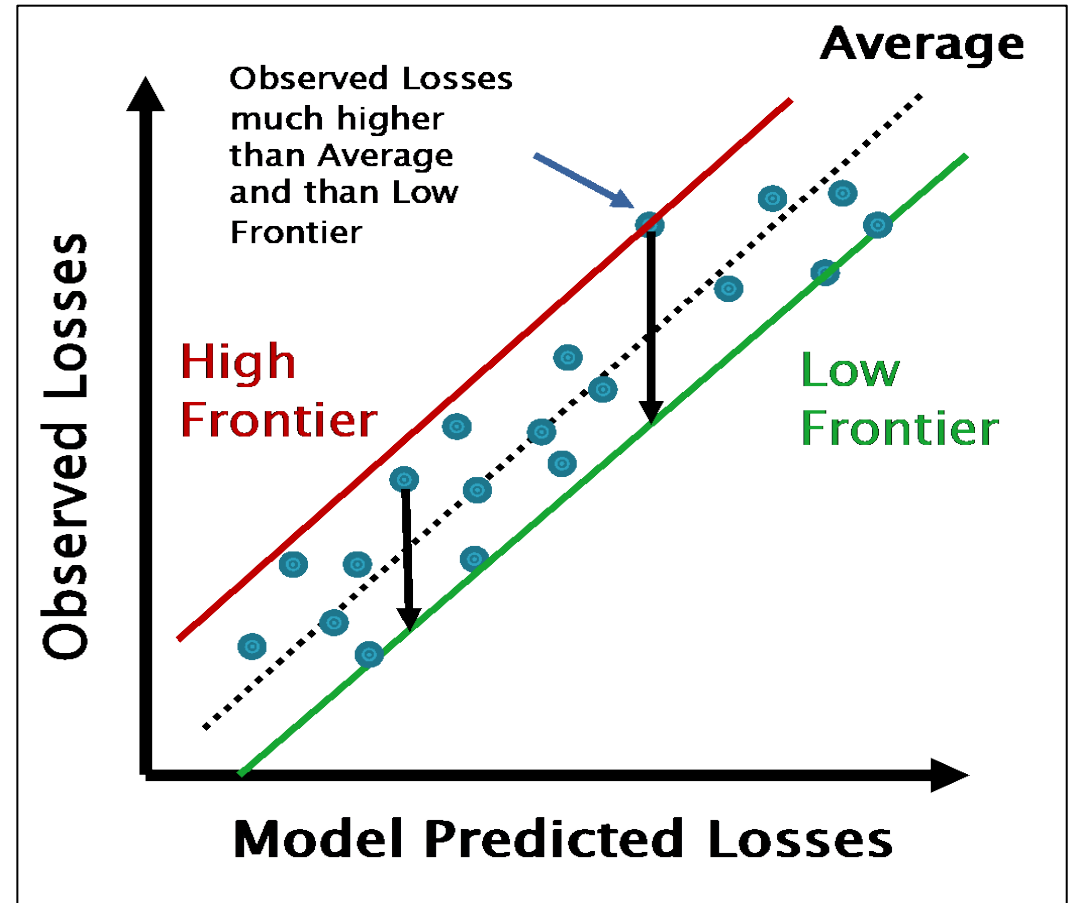

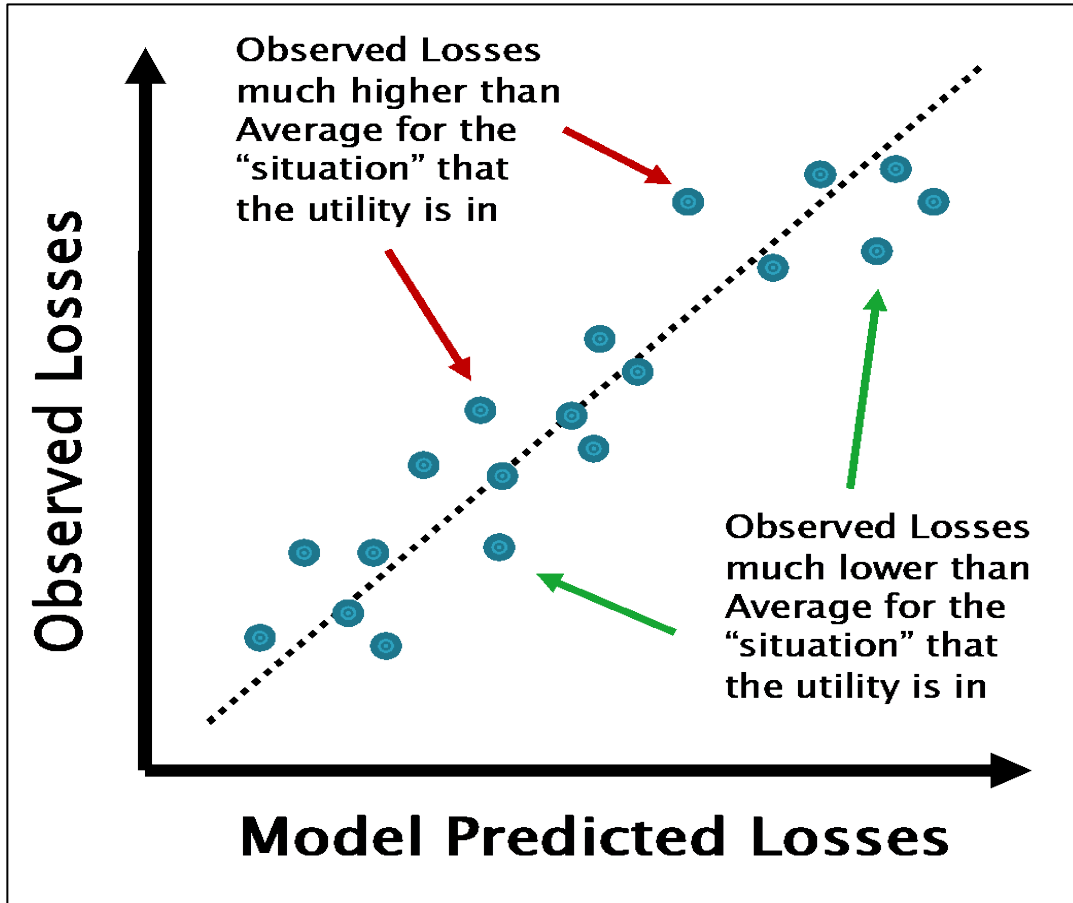

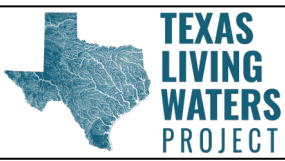

# Frontier Analysis to Assess Water Loss Performance

- 1. Observed Water Losses:** FA starts with a database of utility attributes (mains length, connections, water use, water cost, etc) and Observed water loss for each utility.
- 2. Predicted Water Losses:** FA uses Multi-variate Regression Analysis to develop a mathematical formula for the average water loss performance - known as the Predicted water loss.
- 3. Comparison of Observed and Predicted.** Compares the Observed water loss to the Predicted water loss, revealing good performers and poor performers
- 4. Water Loss Reduction Potential:** Determines the amount of Water Loss Reduction for each utility associated with a chosen target or standard.

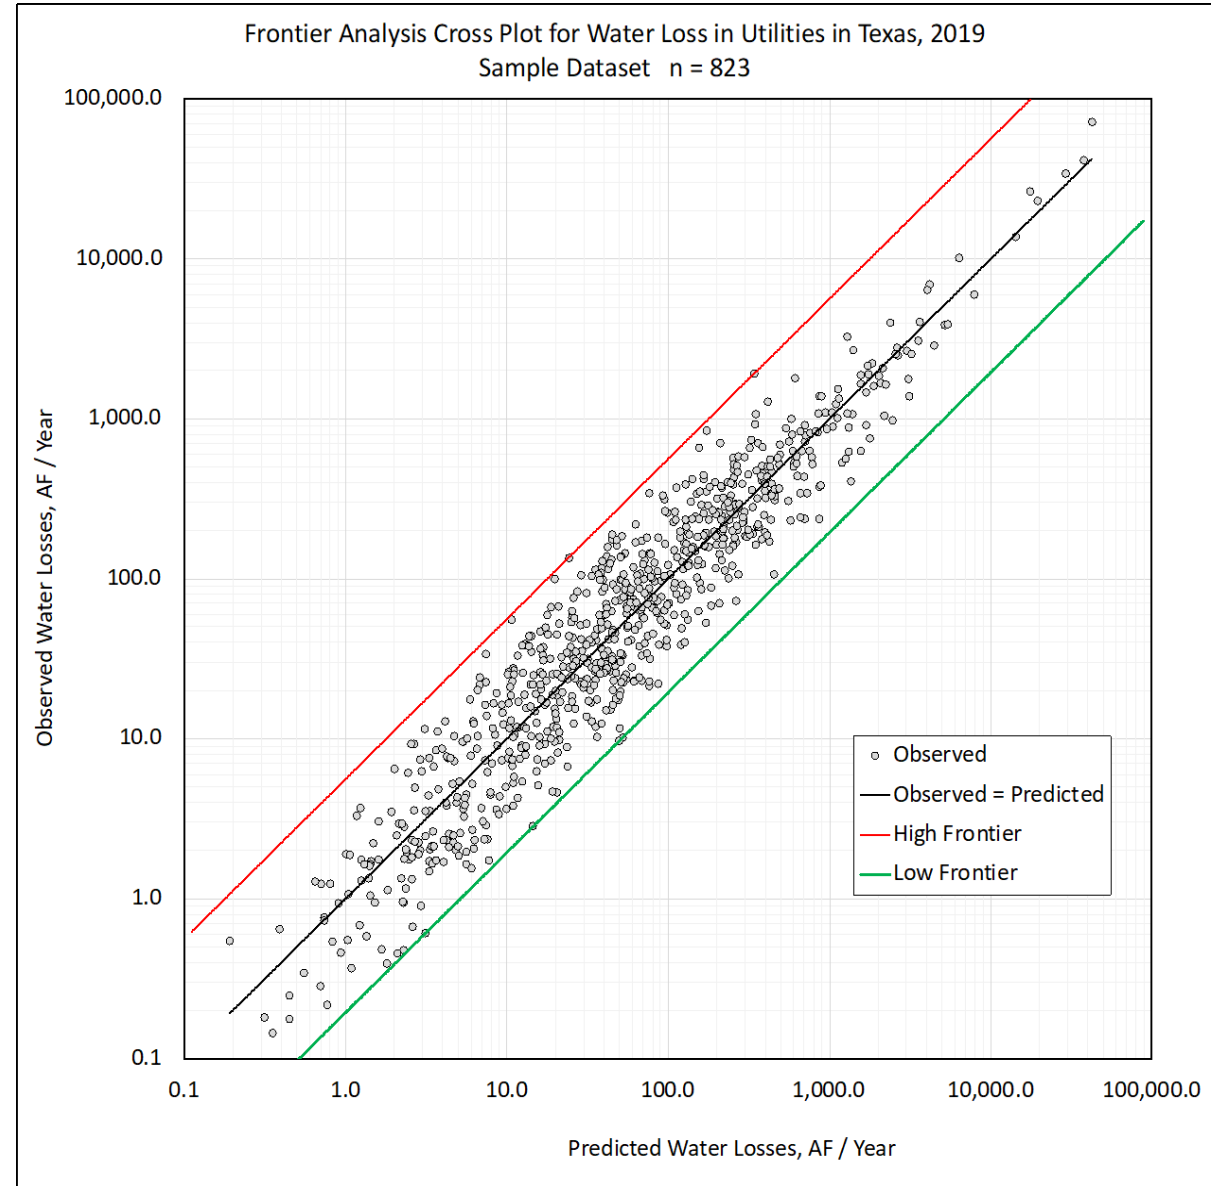

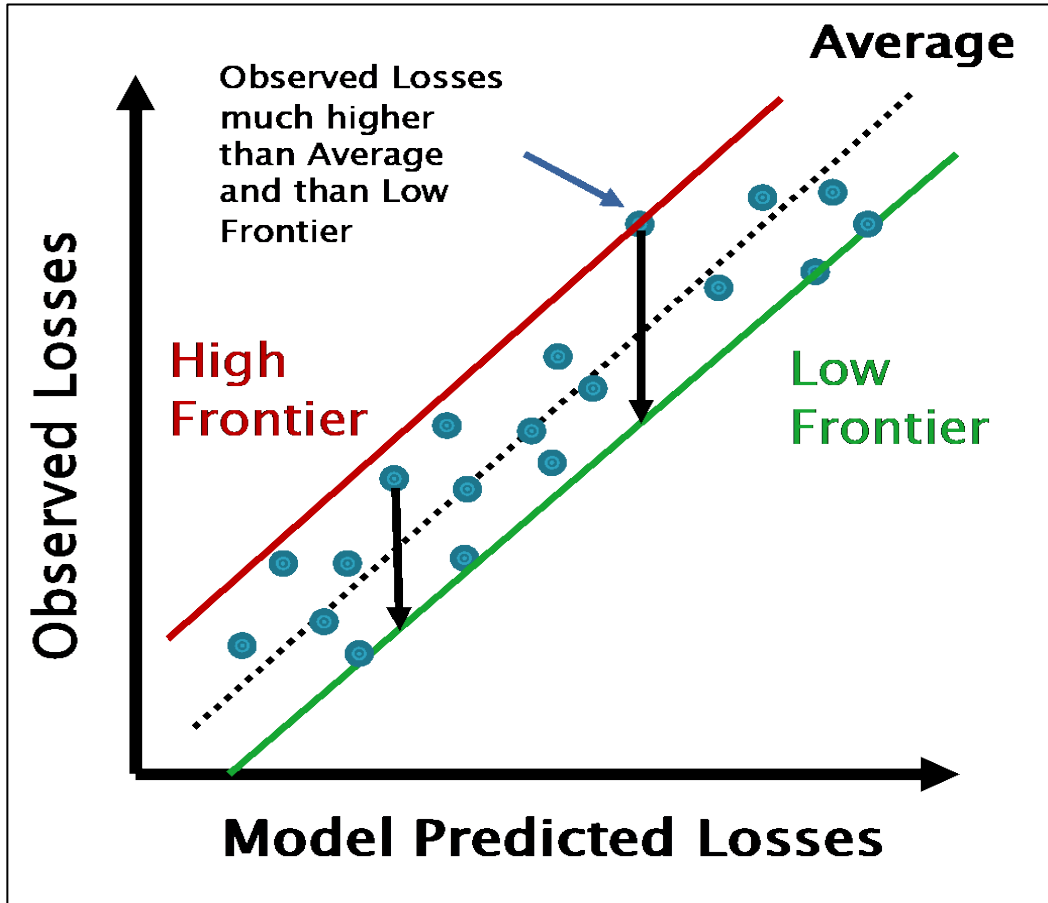

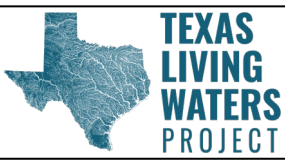

# Graphical Form of Frontier Analysis

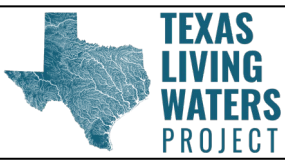

# First FA Application for Water Loss in Texas

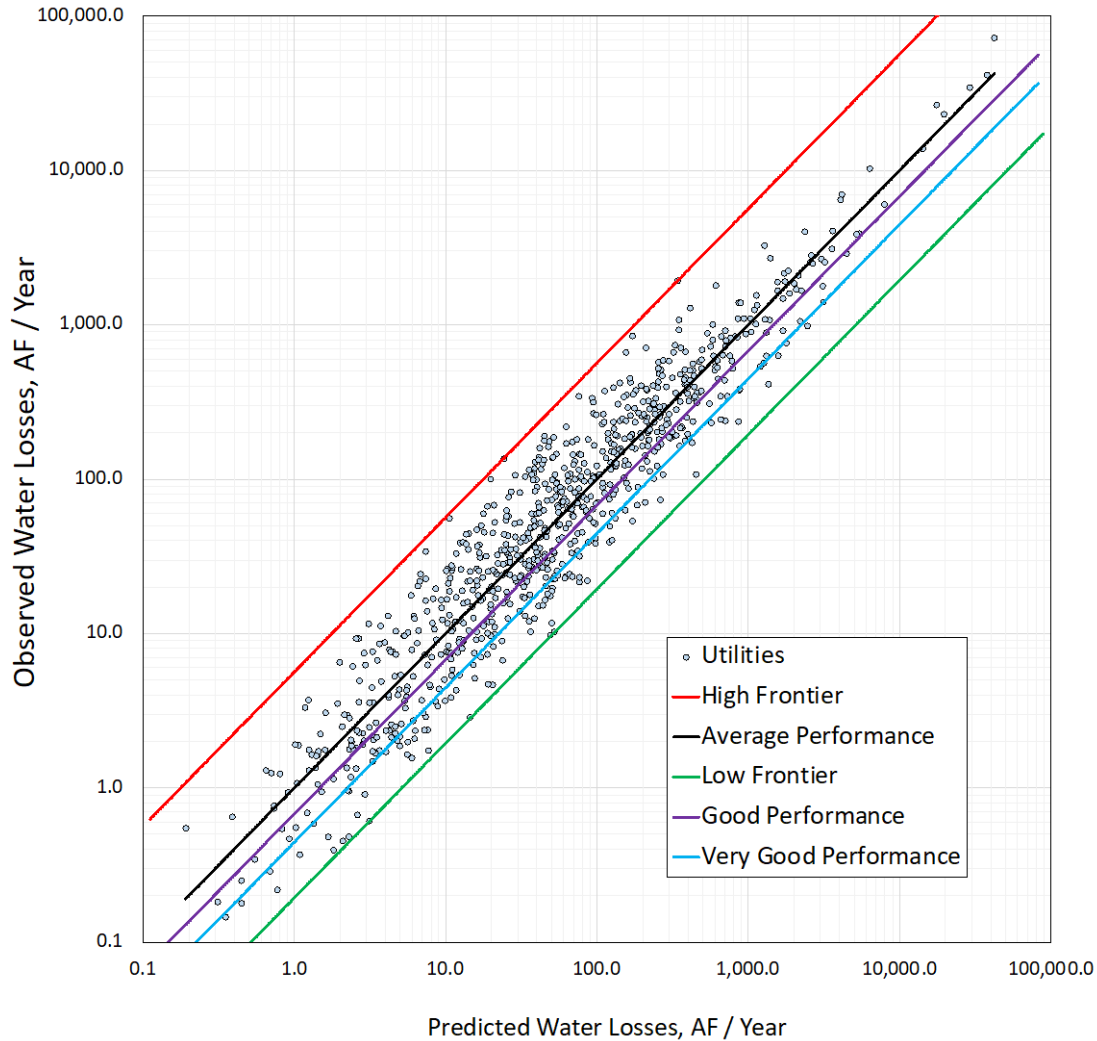

# First FA Application for Water Loss in Texas

Frontier Analysis Plot for Water Loss in Utilities in Texas, 2019  
Sample Dataset n = 823

## Performance Standards

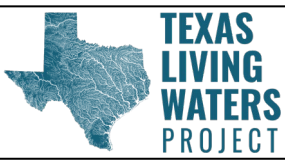

High Frontier – Worst in Texas Sample

Average Performance

Good Performance

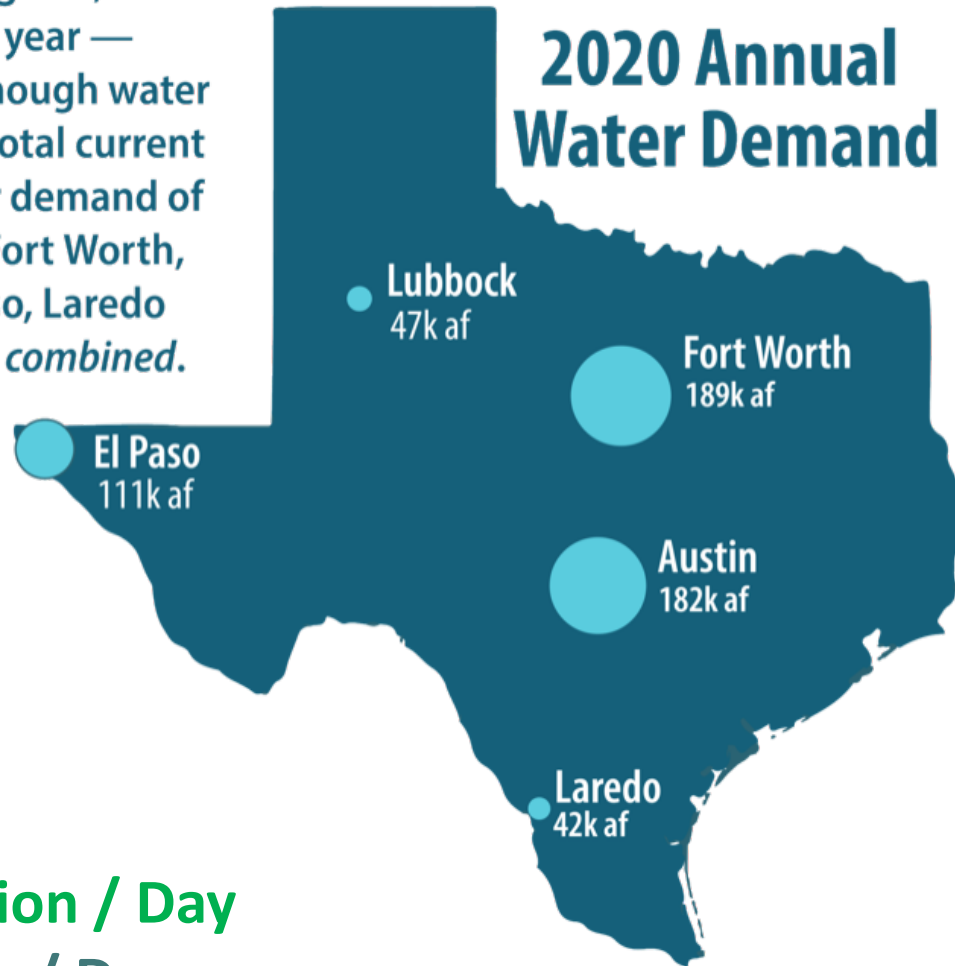

Very Good Performance

Low Frontier - Best in Texas Sample

### 3. Findings – Current Losses

Texas is losing 572,000 acre-feet per year — more than enough water to meet the total current annual water demand of the cities of Fort Worth, Austin, El Paso, Laredo and Lubbock *combined*.

### 2020 Average Annual Water Loss in Texas

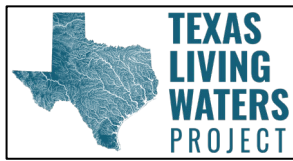

**51 Gallons / Connection / Day**  
17 Gallons / Person / Day

**572,000 AF / Year**

# Estimated Water Loss in 2020 by Size Class

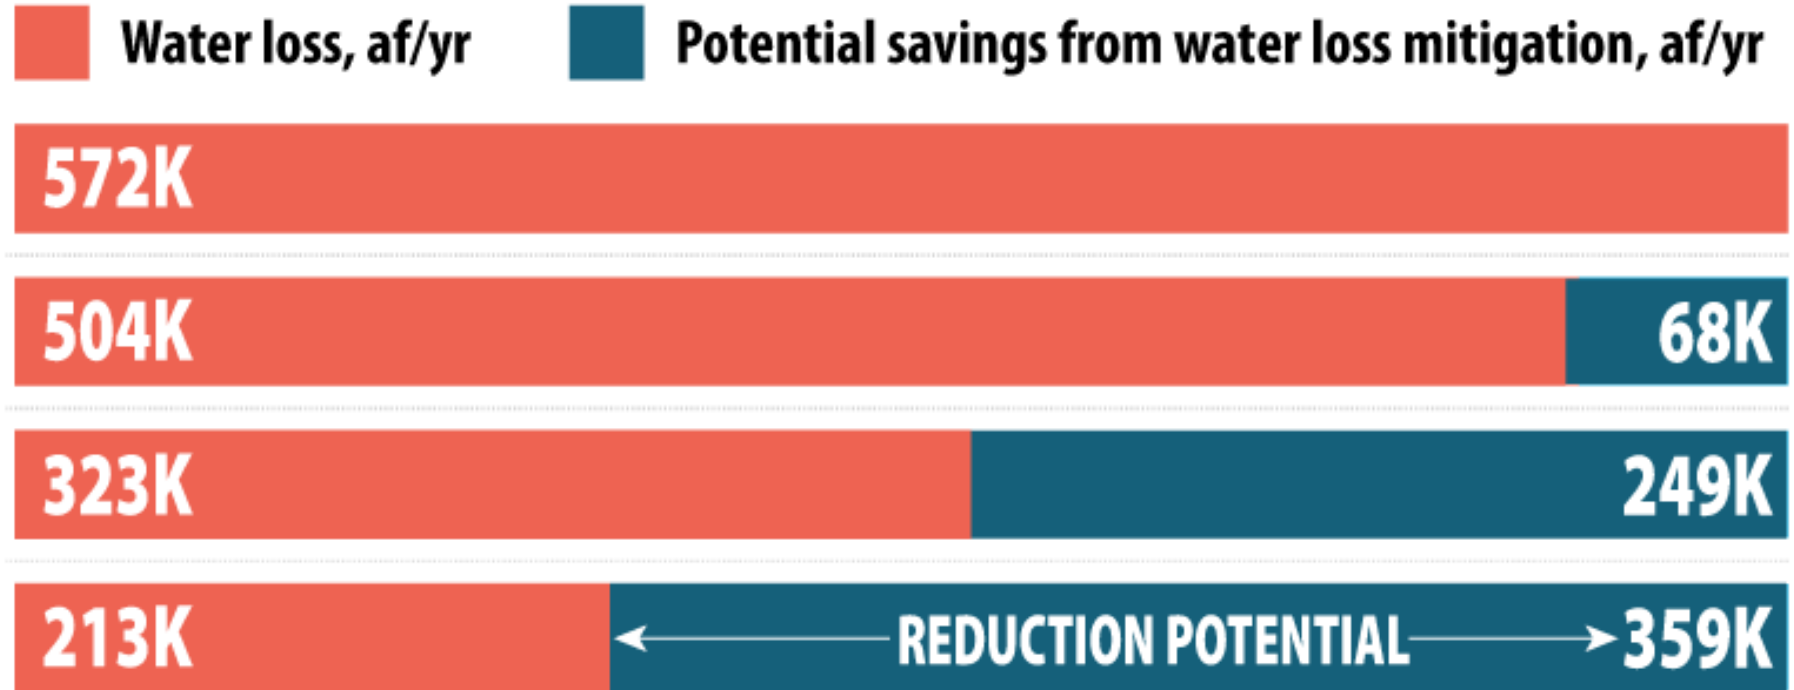

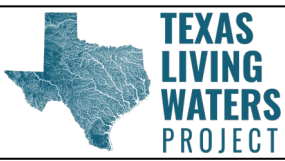

| Size Category | Population Served      | # of Utilities | Total Retail Population | % of Population | Total Retail Connections | % of Connections | Estimated Total Water Losses (af/yr) | % of Water Losses | Estimated Avg Water Losses (g/c/d) |
|---------------|------------------------|----------------|-------------------------|-----------------|--------------------------|------------------|--------------------------------------|-------------------|------------------------------------|
| Very Large    | Greater than 100,000   | 41             | 14.2M                   | 49%             | 4.5M                     | 45%              | 277K                                 | 48%               | 55                                 |
| Large         | Between 25,000-100,000 | 105            | 5M                      | 17%             | 1.8M                     | 18%              | 96K                                  | 17%               | 47                                 |
| Medium        | Between 10,000-25,000  | 228            | 3.5M                    | 12%             | 1.2M                     | 12%              | 70K                                  | 12%               | 50                                 |
| Small         | Less than 10,000       | 3.6K           | 6.5M                    | 22%             | 2.4M                     | 24%              | 129K                                 | 23%               | 47                                 |
| All           |                        | 4K             | 29.2M                   |                 | 10.1M                    |                  | 572K                                 |                   | 51                                 |

**Table 1. Utility Attributes & Estimated Water Loss in 2020 by Size Class.**

Sources for analysis: Texas Water Development Board, Water Loss Audit Data, 2019; 2022 State Water Plan; Texas Commission on Environmental Quality, 2020 Water Utility Data.

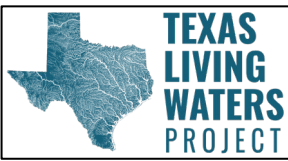

# Water Loss and Reduction Potential - 2020

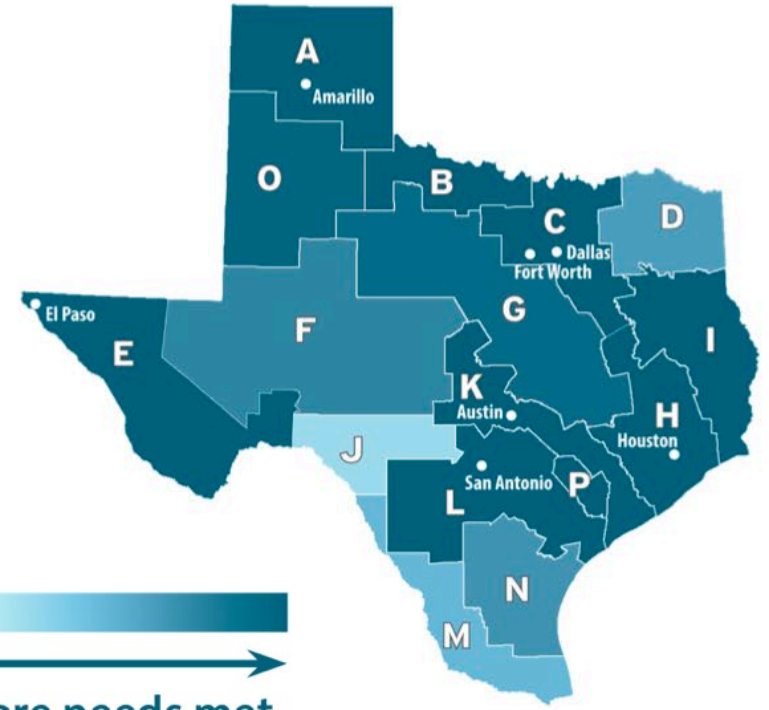

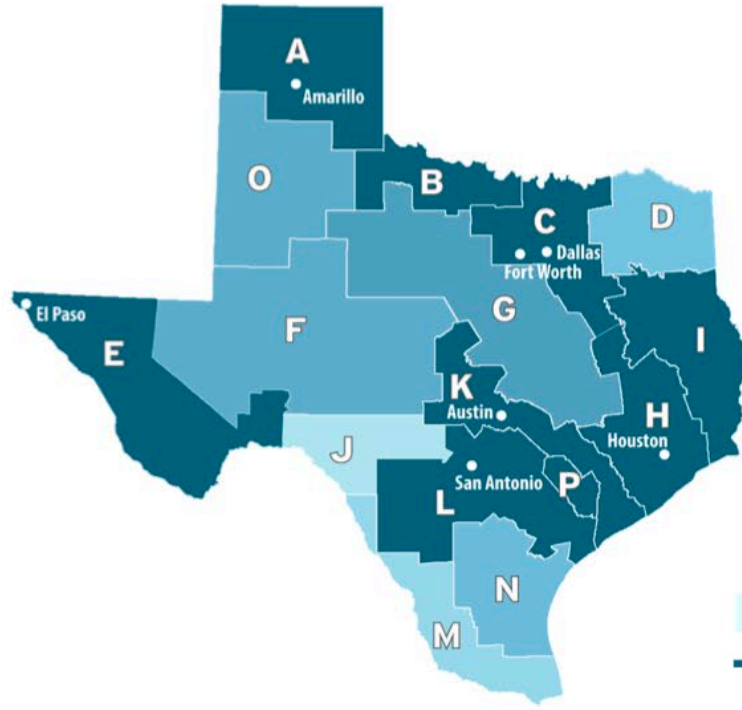

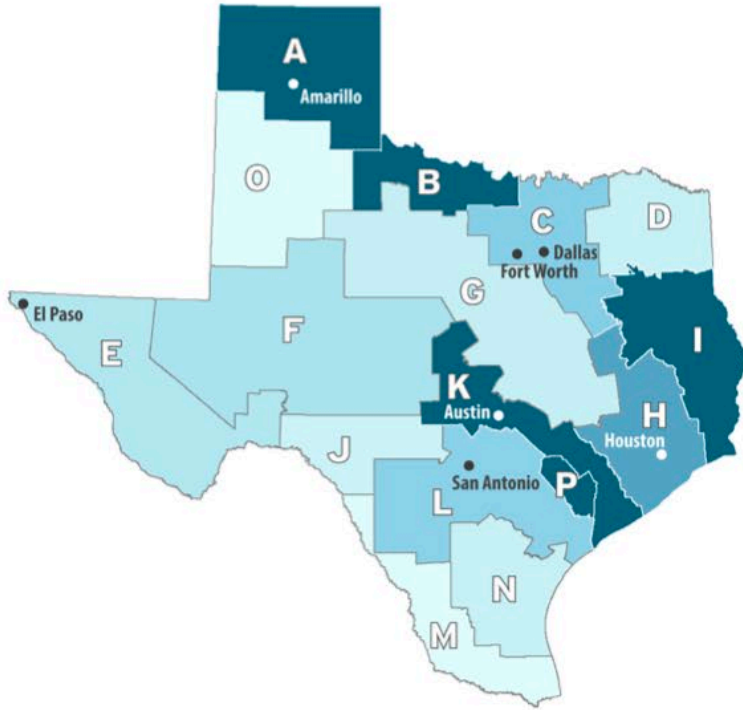

# Growing Municipal Water Demand and 2020 Water Loss Reduction Potential

Average Performance

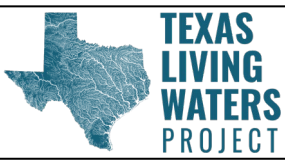

Good Performance

Very Good Performance

Reduction to the Good Level would cover demand growth in 9 of the 16 Regions

Reduction to the Very Good Level would cover demand growth in 11 of 16 Regions

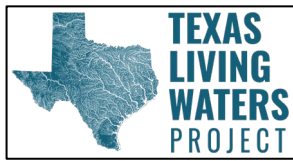

# Growing Municipal Water Demand and 2020 Water Loss Reduction Potential

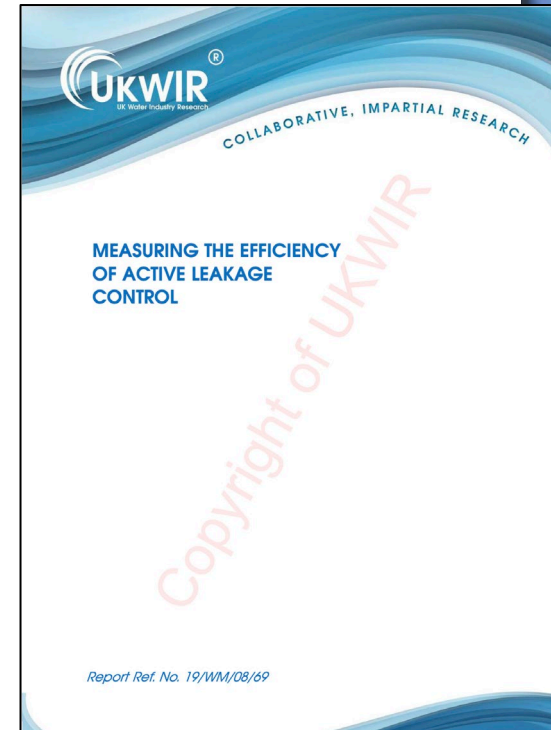

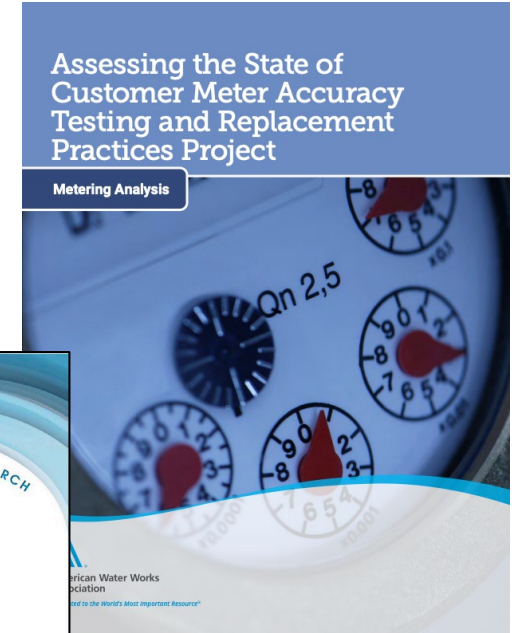

| Utility Size | 2020 Decade<br>Municipal<br>Needs (af/yr)  | Potential Water Savings from Water Loss Reduction as a Percent of Needs |                   |                      |                      |
|--------------|--|---|-------------------|----------------------|----------------------|
|              |  | Supply from<br>Water Loss WMSs  | Average           | Good                 | Very Good            |

### 3. Cost Effectiveness - Data Sources

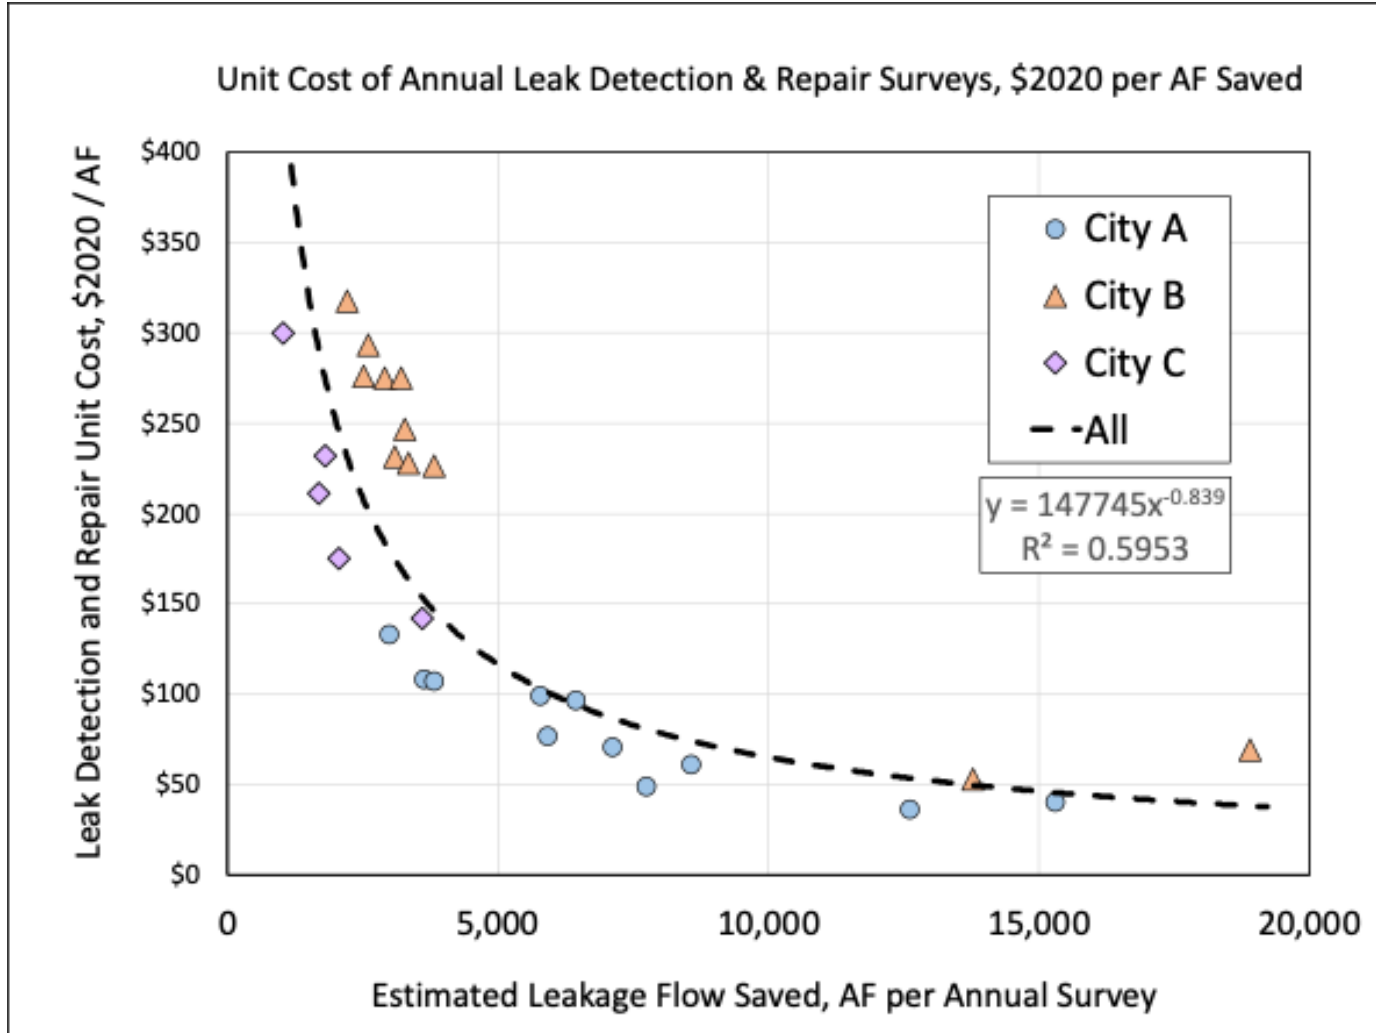

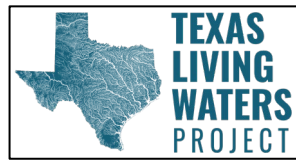

- Research Reports – USA (WRF), Canada (NRC), Europe (UKWIR, OFWAT, WRC, ITA), Australia (Universities – Sydney, Monash), South Africa (WRC)
- Peer-Reviewed Journal Articles (Often anonymous)
- AWWA Journal, Opflow, Manuals (costs often not provided)
- Conference Papers supplemented with Private Discussion
- Product Manufacturers
- Utility Websites, Budgets, Plans, Interviews (anonymity)
- Regulatory Documents
- RFPs and Award Notifications
- EPA Green Reserve Fund
- State Revolving Funds and other Financing Programs
- Water Loss Audits Before and After Projects
- US Military Distribution Studies and Practice Manuals
- Engineering Cost Models – Texas, Indiana, Florida, California

# Leak Detection and Repair: Efficiency Indicators

**Efficiency Indicators**

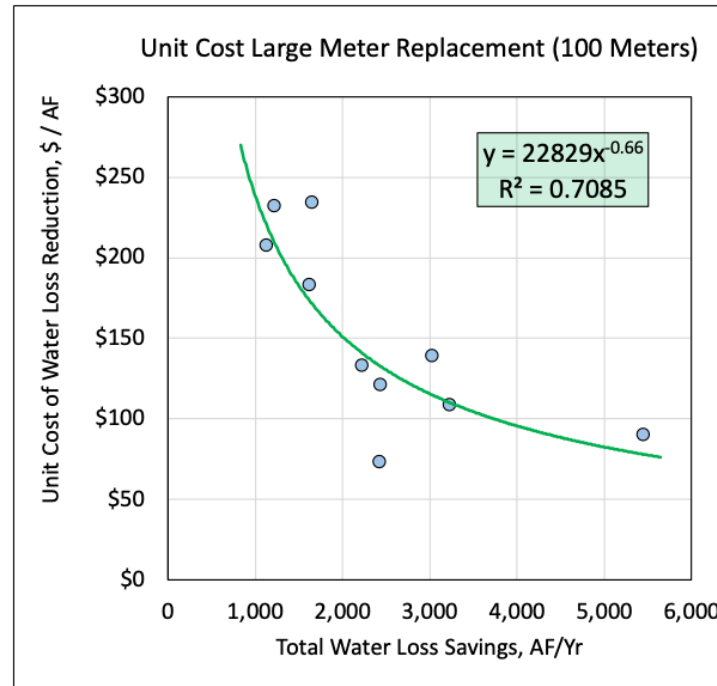

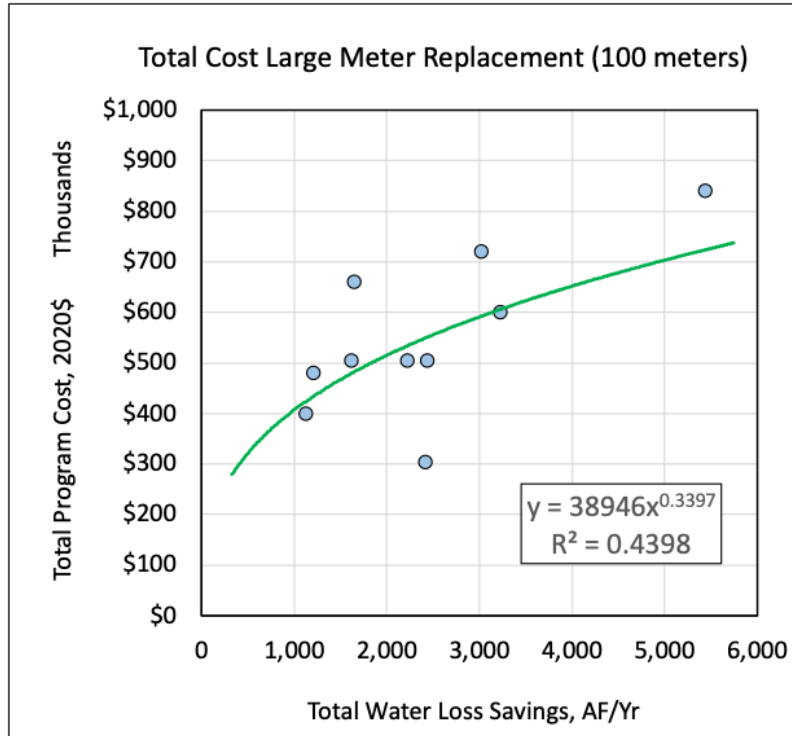

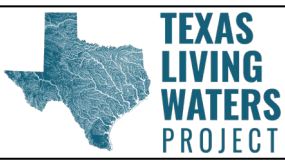

- Leaks Detected / Miles Surveyed
- Leaks Detected / Crew Days Used
- LD&R Cost / Miles Surveyed
- LD&R Cost / Leaks Detected
- LD&R Cost / Leakage Reduction

**Large Economies of Scale:**

- Large Programs
- Many Leaks

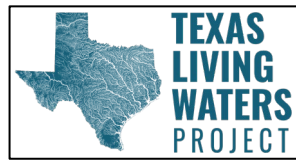

# Large Meter Testing and Replacement

- Based on empirical data from big US cities on old large meters and cost data of meter testing and replacement.
- A Program of replacement of 100 large meters was assumed for illustrative purposes.
- MAJOR economies of Scale

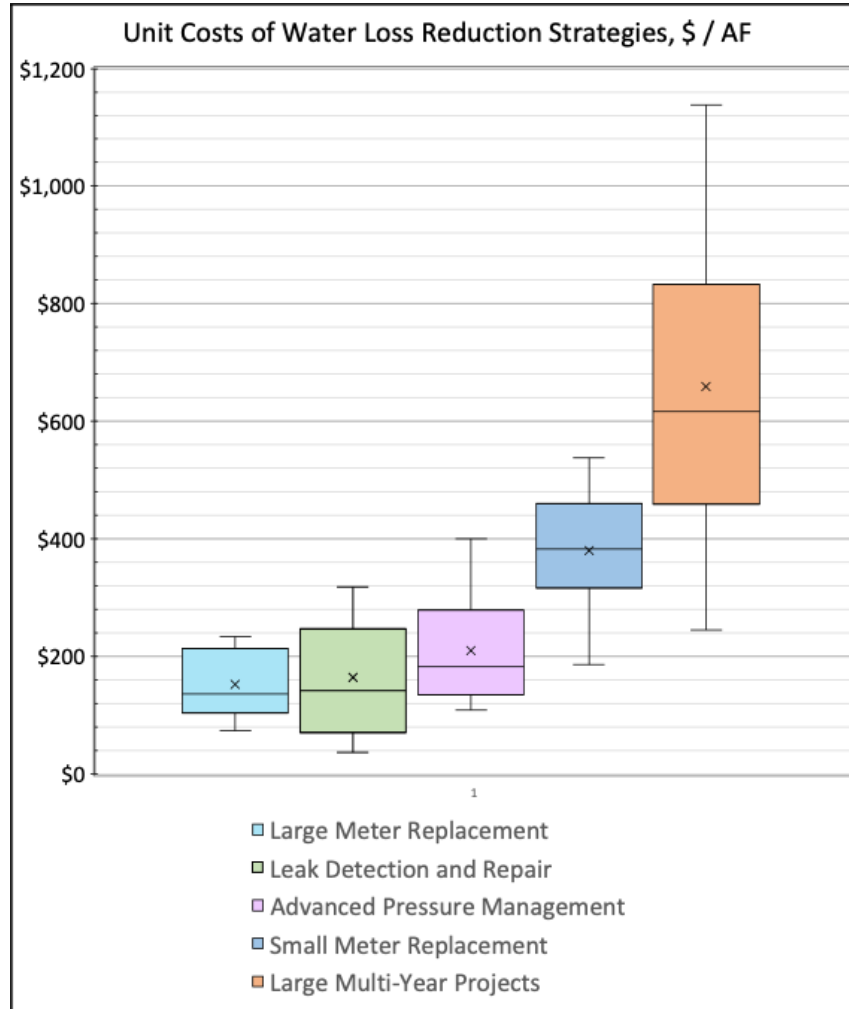

# Comparison to Other Water Management Strategies

Water Loss Reduction Project data was collected and analyzed to determine a cost per AF reduced and compared to cost data on recommended water supply and conservation projects in the 2022 SWP

For the most part, Water Loss Reduction is less expensive than other “sources” of water

| Summary WMS Category - Supply Side Only | Number of Recommended Projects | Unit Cost (from Table 7-6) |
|---|--------------------------------|----------------------------|
| Aquifer Storage and Recovery            | 153                            | \$437                      |
| Conjunctive Use                         | 131                            | \$1,724                    |
| Direct Potable Reuse                    | 18                             | \$1,321                    |
| Groundwater Desalination                | 29                             | \$920                      |
| Groundwater Wells and Related           | 625                            | \$599                      |
| Indirect Reuse                          | 550                            | \$391                      |
| Other Direct Reuse                      | 93                             | \$962                      |
| Other Surface Water                     | 1225                           | \$744                      |
| <b>TOTAL</b>                            | <b>2824</b>                    |                            |

Weighted Average Unit Cost for Supply Side WMS = **\$695**

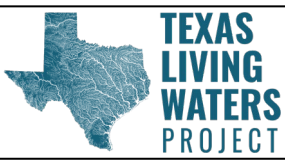

| Category of WMS - Demand Side | Number of Recommended Projects | Unit Cost (from Table 7-6) |
|-------------------------------|--------------------------------|----------------------------|
| Agricultural Conservation     | 155                            | \$284                      |
| Industrial Conservation       | 141                            | \$680                      |
| Municipal Conservation        | 1877                           | \$675                      |
| <b>TOTAL</b>                  | <b>2173</b>                    |                            |

Weighted Average Unit Cost for Demand Side WMS = **\$406**

Without Agricultural Conservation in Urban Areas, Unit Cost = **\$675**

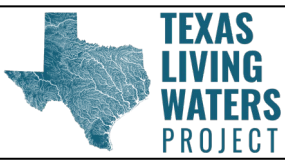

## 4. Recommendations

- **Legislature:**
  - Prioritize financial assistance to utilities with high losses
  - Additional funding to TWDB for Conservation and Water Planning Staff
- **TWDB:**
  - Prioritize water loss data accuracy, transparency and accountability
  - Provide technical assistance and improve access to funding
  - Ensure those utilities receiving any financial assistance meet water loss standard, or have specific plans to do so
  - Include Water Loss Control as a distinct SWP Water Management Strategy
- **Utilities**
  - Accurately evaluate the financial impact of water losses
  - Invest in resilient infrastructure
  - Aggressively mitigate and sustain low water losses

## 5. Recent Developments

- **Legislature:**

- Texas House Water Caucus formed – a new, bi-partisan collaborative focused on water issues
- Discussions underway for additional investment in Texas water infrastructure, including for water loss reduction

- **TWDB:**

- New Water Loss Audit Validation Program
- Inclusion of Water Loss Control as a distinct SWP Water Management Strategy
- New Water Loss Threshold

- **Utilities**

- New water loss reduction technologies being deployed.
- Assessment of current programs underway (SAWS case next)

- **TxAWWA** Water Loss Committee formed

# Zones

## SAWS – Proactive Leak Detection

Satellite Leak Detection Validation activities:

Key – What Tools? Prioritize Field.

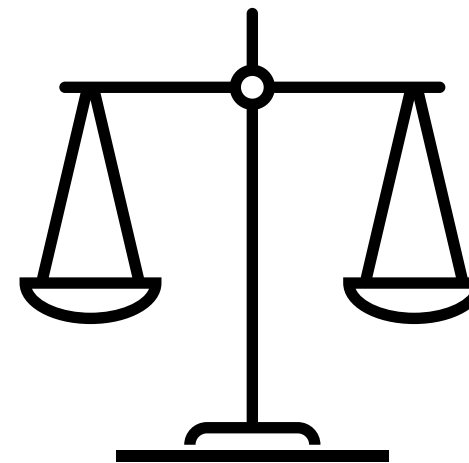

- Zone 1
  - August to December 2022
  - 436 POI's
- Currently Zone 2
  - Current
  - 360 POI's

# A Resiliency Strategy

## Valuation Considerations are Challenging

- #1 Holds Real losses cost effectively lower (multiple tools)
- #2 Asset Management to include some production meter controls
- Data as well as AMI (electronic customer meters leveraged)

Baseline Annual 4,000K AF **\$20M** – 75M Annual

Programming to nearly double AF savings???

Reactive \$\$ 2 X above range

## GOAL:

SAWS to identify and add more proactive Intelligence and repair to improve awareness times as well as resiliency for the potable network

# SAWS's Interest in Water Loss

- Efficiency Measure
- Executive Management Goal
- State Requirement
- Canary in Coalmine!
- Public Perceptions
- Saving Water & Money
